**What is COVID-19?** — COVID-19 stands for "coronavirus disease 2019." It is caused by a virus called SARS-CoV-2. The virus first appeared in late 2019 and quickly spread around the world.

The virus that causes COVID-19 mainly spreads from person to person. This usually happens when an infected person coughs, sneezes, or talks near other people who are not vaccinated. People with COVID-19 can have fever, cough, trouble breathing, and other symptoms. But a person can be infected, and spread the virus to others, even without having any symptoms.

Most people who get COVID-19 will not get severely ill. But some do.

This article has information for people who are **pregnant**. More general information about COVID-19 is available separately. (See "COVID-19 overview".)

**What are the symptoms of COVID-19?** — Symptoms usually start 4 or 5 days after a person is infected with the virus. But in some people, it can take up to 2 weeks for symptoms to appear. Many people never show symptoms at all.

When symptoms do happen, they can include:

- Fever
- Cough
- Trouble breathing
- Feeling tired
- Shaking chills
- Muscle aches
- Headache

- Sore throat
- Problems with sense of smell or taste

Some people have digestive problems like nausea or diarrhea.

Pregnant people with COVID-19 can have any of the above symptoms or no symptoms.

For most people, symptoms will get better within a few weeks. But in others, COVID-19 can lead to serious problems like pneumonia, not getting enough oxygen, heart problems, or even death.

**Are pregnant people at high risk for severe symptoms?** — Experts do not yet know a lot about COVID-19 and pregnancy. From what they know so far, pregnant people do not seem more likely than other people to get the infection.

However, compared with females of the same age who are not pregnant, pregnant people with COVID-19 seem to be more likely to get very sick and need to stay in the ICU. ("ICU" is short for "intensive care unit.") In pregnant people, the risk of getting very sick is highest in those who are age 35 or older, or have certain health conditions like obesity, high blood pressure, or diabetes. But most people recover before having their baby, and do not need to stay in the hospital.

**What should I do if I have symptoms?** — If you have a fever, cough, trouble breathing, or other symptoms of COVID-19, **call** your doctor, nurse, or midwife. They can tell you what to do and whether you need to be seen in person. They will also tell you if you should be tested for the virus that causes COVID-19.

**If I am pregnant and get infected, can I pass the virus to my baby?** — Experts think it might be possible for a baby to get the infection while still in the uterus. But this seems to be very uncommon. And when it does happen, most babies do not get very sick.

It is also possible to pass the virus to the baby during childbirth or after the baby is born. If you have COVID-19 when you give birth, there are ways to lower this risk.

**Can COVID-19 cause problems with pregnancy?** — From what experts know so far, most people who get COVID-19 during pregnancy will not have serious problems. But problems can happen if the mother becomes seriously ill.

Pregnant people who get COVID-19 might have an increased risk of preterm birth. This is when the baby is born before 37 weeks of pregnancy. This seems to be more of a risk in people who get very sick and have pneumonia. Preterm birth can be dangerous, because babies who are born too early can have serious health problems.

**How is COVID-19 treated?** — Most people with mild illness will be able to stay home while they get better. Mild illness means you might have symptoms like fever and cough, but you do not have trouble breathing.

People with serious symptoms or other health problems might need to go to the hospital. If you need to be treated in the hospital, the doctors and nurses will also monitor your baby's health.

Doctors are studying several possible treatments for COVID-19. In certain cases, doctors might recommend medicines that seem to help some people who are severely ill. But some medicines are not safe to take if you are pregnant.

Fever is a common symptom of COVID-19. If you are pregnant and get a fever, ask your doctor, nurse, or midwife what to do. Acetaminophen (sample brand name: Tylenol) can be used to treat a fever and is generally safe to take during pregnancy.

**Can COVID-19 be prevented?** — The best way to prevent COVID-19 is to get vaccinated.

In the United States, the first vaccines became available in late 2020. They were not originally tested in people who were pregnant or breastfeeding, but are being studied more over time. Many pregnant people have gotten the vaccine without any problems. Experts recommend that pregnant people consider getting the vaccine. Your doctor or nurse can help you make this decision.

Experts believe that vaccines will be one of the most important ways to control the COVID-19 pandemic. People who are fully vaccinated are at much lower risk of getting or spreading the virus. More information about COVID-19 vaccines is available separately. (See "COVID-19 vaccines".)

If you are **not** yet vaccinated, you can protect yourself and others by "social distancing" (staying at least 6 feet, or 2 meters, away from other people) and wearing a face mask when you are in public. You should also be sure to wash your hands often.

**Will my regular prenatal appointments change?** — Your doctor, nurse, or midwife will work with you to make a plan for your visits during pregnancy. If you live in an area where there are a lot of cases of COVID-19, there will likely be some changes. For example:

- Your partner might not be able to join you for appointments
- If you have any symptoms of COVID-19, you will probably need to wear a medical mask during your appointments
- Your doctor, nurse, or midwife might group certain tests together so you don't need to go in as often
- Your doctor, nurse, or midwife might suggest replacing some visits with a phone or video call

These changes can feel stressful. It can help to keep in mind that the goal is to help protect you and others.

**What will my delivery be like?** — Different hospitals and birth centers have different rules to help keep people safe. These might include guidelines for things like wearing a mask and how many visitors you can have. Your doctor, nurse, or midwife will talk to you about what to expect.

You will be checked for fever and other symptoms of COVID-19 when you arrive to give birth. This might happen earlier if you are scheduled to be "induced" or have a cesarean birth ("c-section"). You might be tested for the virus, too.

If you have COVID-19 when you go into labor, the doctors and nurses will take steps to protect others around you. For example, you will need to wear a medical mask. You will still be able to have a vaginal birth, if that is what you planned. You don't need a c-section just because you are sick.

If you have COVID-19, your doctor or nurse might suggest staying apart from your baby until you get better. This will depend on how sick you are, whether your baby has been tested for the virus, and other factors. If you do hold your baby and keep them in the room with you, you will need to wear a face mask to lower the risk of spreading the infection. You might need to take other precautions, too. These things can be hard. But they are important in order to protect your baby.

**What if I want to breastfeed?** — Breastfeeding has many benefits for both you and your baby. If you have COVID-19, there might be a very small chance of passing the infection to your baby through breast milk. But no babies have become very sick in this way.

Whether or not you breastfeed, it's important to be extra careful when feeding or holding your baby. You could pass the virus to your baby through close contact. You can protect your baby by washing your hands often and wearing a face mask while you feed them.

You might choose to pump breast milk for your baby. If you are sick, wash your hands carefully before pumping, and wear a mask while you pump. If possible, have a healthy person clean your pump thoroughly between uses.

**What can I do to cope with stress and anxiety?** — It's normal to feel anxious or worried about COVID-19. If you are pregnant, you might feel sad about having to cancel celebrations and stay away from relatives and friends.

You can take care of yourself by:

- Getting vaccinated
- Taking breaks from the news
- Getting regular exercise and eat healthy foods
- Trying to find activities that you enjoy and can do in your home
- Staying in touch with your friends and family members

Keep in mind that most pregnant people do not get severely ill from COVID-19. It helps to be prepared, and it's important to do what you can to lower your risk. But try not to panic.

**What if I have other questions?** — If you have other questions, talk to your doctor, nurse, or midwife. They can help you with questions like:

- What symptoms should I be concerned about?
- What should I do if I think I was exposed to COVID-19?
- What medicines can I use to treat symptoms of COVID-19 while I am pregnant?
- Where can I find support if I feel anxious or depressed?

The answers to these questions, and others, will depend on your situation.

**Where can I go to learn more?** — As we learn more about this virus, expert recommendations will continue to change. Check with your doctor or public health official to get the most updated information about how to protect yourself and your family.

For information about COVID-19 in your area, you can call your local public health office. In the United States, this usually means your city or town's Board of Health. Many states also have a "hotline" phone number you can call.

You can find more information about COVID-19 at the following websites:

- United States Centers for Disease Control and Prevention (CDC): [www.cdc.gov/COVID19](http://www.cdc.gov/COVID19)
- World Health Organization (WHO): [www.who.int/emergencies/diseases/novel-coronavirus-2019](http://www.who.int/emergencies/diseases/novel-coronavirus-2019)

All topics are updated as new evidence becomes available and our [peer review process](#) is complete.
